

Install a BizDock instance

BizDock runs on Linux and Docker (see <http://www.docker.io>). The command line installer supports Linux x86_64 architectures.

Install BizDock on a Linux host

Move to a folder on your Linux host and run:

```
$ curl -sL https://raw.githubusercontent.com/theAgileFactory/bizdock-installation/master/cli/create.sh > create.sh
```

Then set the execution rights for the script:

```
chmod u+x create.sh
```

Then you can run the script in a folder of your choice:

```
./create.sh
```

Obviously this will run the installation with the default parameters. Please connect on our [GitHub installation page](#) to learn more about the possible parameters.

Install BizDock on a different system

We are using Docker which means that BizDock should be able to run on any OS.

If you want to help us to find out if this is possible, please contact us via GitHub.
